Synthetic-aperture radar (SAR) is a form of radar that is used to create two-dimensional images or three-dimensional reconstructions of objects, such as landscapes. SAR uses the motion of the radar antenna over a target region to provide .. SAR requires that echo captures be taken at multiple antenna positions. The more.

Multi-Antenna Synthetic Aperture Radar - Bookyage

Synthetic aperture radar (SAR) is a well-known remote sensing technique, but conventional single-antenna SAR is inherently limited by the minimum antenna.

A promising candidate for such a new radar imaging technique is digital beamforming on receive where the receiving antenna is split into multiple sub- apertures.

The needed correlation summation changed from a pair of scalar ones to a single vector one. Furthermore, the fusion of multi-frequency images can allow us to fuse the information acquired about the object observed in many spectral bands, in the same spatial context. He has authored more than papers. However, that presumption incorrectly implied that such lenses and their in It is important to realize that only those sub-wavelength differences of successive ranges from the transmitting antenna to each target point and back, which govern signal phase, are used to refine the resolution in any geometric dimension. This mode is not a very continuous imaging mode; however, has high azimuth resolution. Academic Press Library in Signal Processing.
