Rijndael is a fast block cipher, with variable key length and block sizes each can be independently set to 64 or 128 bits. Although Diffie-Hellman was a spectacular breakthrough, the iterative nature of the key derivation process was inconvenient.

The insecurity of construction also pinpoints the danger of encryption cycles.

It is essentially an electronic identification card that can be used to identify a person, company, or a computer. We observed that using a simple variant of the Diffie-Hellman protocol it is possible to build a public key encryption scheme, satisfying all the desired properties, and in fact achieving even stronger security than those sought in [DH]. Keys can be created or generated in many ways, but computers commonly generate .
